Review of Fractions

1. Adding Fractions with a Common Denominator: Add the numerators.

$$\frac{a}{b} + \frac{c}{b} = \frac{a+c}{b}$$
 but avoid this common error

$$\frac{1}{7} + \frac{3}{7} = \frac{1+3}{7} = \frac{4}{7}$$

$$\frac{1}{x} + \frac{3}{x} = \frac{1+3}{x} = \frac{4}{x}$$

2. Adding Fractions with Different Denominators: Obtain a common denominator and add numerators.

$$\frac{a}{b} + \frac{c}{d} = \frac{ad}{bd} + \frac{bc}{bd} = \frac{ad + bc}{bd}$$

$$\frac{a}{b} + \frac{c}{d} = \frac{ad}{bd} + \frac{bc}{bd} = \frac{ad + bc}{bd}$$
 Examples:
$$\frac{2}{3} + \frac{1}{5} = \frac{2 \cdot 5}{3 \cdot 5} + \frac{3 \cdot 1}{3 \cdot 5} = \frac{10 + 3}{15} = \frac{13}{15}$$

$$\frac{2}{x} + \frac{1}{y} = \frac{2 \cdot y}{x \cdot y} + \frac{x \cdot 1}{x \cdot y} = \frac{2y + x}{xy}$$

3. Multiplying Fractions: Multiply their numerators and multiply their denominators.

$$\frac{a}{b} \cdot \frac{c}{d} = \frac{ac}{bd}$$

$$3: \boxed{\frac{2 \cdot 4}{3 \cdot 5} = \frac{2 \cdot 4}{3 \cdot 5} = \frac{8}{15}}$$

Examples: $\frac{2}{3} \cdot \frac{c}{d} = \frac{ac}{bd}$ Examples: $\frac{2}{3} \cdot \frac{4}{5} = \frac{2 \cdot 4}{3 \cdot 5} = \frac{8}{15}$ $\frac{2a}{x} \cdot \frac{4a}{y} = \frac{2a \cdot 4a}{x \cdot y} = \frac{8a}{x}$

4. Reducing Fractions: Factor numerator and denominator and cancel common factors.

$$\frac{ac}{bc} = \frac{a}{b} = \frac{a}{b}$$

$$: \frac{6}{15} = \frac{2 \cdot 3}{5 \cdot 3} = \frac{2 \cdot 3}{5 \cdot 3} = \frac{2}{5}$$

$$\boxed{\frac{8xyz}{12axz} = \frac{2 \cdot 4 \cdot x \cdot y \cdot z}{3 \cdot 4 \cdot a \cdot x \cdot z} = \frac{2 \cdot \cancel{A} \cdot \cancel{x} \cdot y \cdot \cancel{z}}{3 \cdot \cancel{A} \cdot a \cdot \cancel{x} \cdot \cancel{z}} = \frac{2y}{3a}}$$

5. Negative Fraction: The negative sign can be applied to the numerator or to the denominator or to the fraction as a whole.

$$\frac{-a}{b} = \frac{a}{-b} = -\frac{a}{b}$$

$$\frac{-a}{b} = \frac{a}{-b} = -\frac{a}{b}$$
 Examples:
$$\frac{-2}{3} = \frac{2}{-3} = -\frac{2}{3}$$

$$\frac{a}{-a} = -\frac{a}{a} = -\frac{\alpha}{a} = -1$$

$$\frac{x-3}{3-x} = \frac{x-3}{-(x-3)} = -\frac{x-3}{x-3} = -\frac{x-3}{x-3} = -1$$

Review of Fractions

6. Dividing Fractions: Invert the divisor (second fraction) and multiply.

$$\frac{a}{b} \div \frac{c}{d} = \frac{a}{b} \cdot \frac{d}{c} = \frac{ad}{bc}$$

$$\frac{a}{b} \div \frac{c}{d} = \frac{a}{b} \cdot \frac{d}{c} = \frac{ad}{bc}$$
 Example:
$$\frac{2}{3} \div \frac{5}{7} = \frac{2}{3} \cdot \frac{7}{5} = \frac{2 \cdot 7}{3 \cdot 5} = \frac{14}{15}$$

7. Dividing Fractions: Invert the divisor (bottom fraction) and multiply.

$$\frac{\frac{a}{b}}{\frac{c}{d}} = \frac{a}{b} \cdot \frac{d}{c} = \frac{ad}{bc}$$

$$\frac{\frac{a}{b}}{\frac{c}{d}} = \frac{a}{b} \cdot \frac{d}{c} = \frac{ad}{bc}$$
Examples:
$$\frac{\frac{2}{3}}{\frac{5}{7}} = \frac{2 \cdot 7}{3 \cdot 5} = \frac{2 \cdot 7}{3 \cdot 5} = \frac{14}{15}$$

$$\frac{\frac{2x}{3z}}{\frac{5x}{7y}} = \frac{2x}{3z} \cdot \frac{7y}{5x} = \frac{2 \cdot 7 \cdot x \cdot y}{3 \cdot 5 \cdot x \cdot z} = \frac{14y}{15z}$$

8. Any Number is a Fraction: Any number (or expression) can be made a fraction with a denominator of 1.

$$a = \frac{a}{1}$$

Examples:
$$4 = \frac{4}{1}$$

$$\pi = \frac{\pi}{1}$$
 $x = \frac{\pi}{1}$

$$x = \frac{x}{1}$$

$$x - 3 = \frac{x - 3}{1}$$

9. Simplifying Compound Fractions: Using the rules above, first combine the terms of the numerator into a single fraction. Second, combine the terms of the denominator into a single fraction. Third, invert and multiply.

Example:
$$\frac{\frac{x}{y}}{\frac{1}{1}}$$

Example:
$$\left[\frac{\frac{x}{y} + 2}{\frac{1}{x} - y} \right]$$
 1) $\left[\frac{\frac{x}{y} + \frac{2}{1}}{\frac{1}{x} - y} = \frac{\frac{x}{y} + \frac{2y}{y}}{\frac{1}{x} - y} = \frac{\frac{x + 2y}{y}}{\frac{1}{x} - y} \right]$

2)
$$= \frac{\frac{x+2y}{y}}{\frac{1}{x} - \frac{y}{1}} = \frac{\frac{x+2y}{y}}{\frac{1}{x} - \frac{xy}{x}} = \frac{\frac{x+2y}{y}}{\frac{1-xy}{x}}$$

2)
$$= \frac{\frac{x+2y}{y}}{\frac{1}{x} - \frac{y}{1}} = \frac{\frac{x+2y}{y}}{\frac{1}{x} - \frac{xy}{x}} = \frac{\frac{x+2y}{y}}{\frac{1-xy}{x}}$$
 3)
$$\frac{\frac{x+2y}{y}}{\frac{1-xy}{x}} = \frac{x+2y}{y} \cdot \frac{x}{1-xy} = \frac{x(x+2y)}{y(1-xy)}$$
